#### General Notes:
- Statistical validity of estimates of percent susceptibility for organisms for which there are fewer than 30 isolates reported is limited. Please take this into consideration when interpreting the reported results.
- Some organisms for which there were only very small numbers have been excluded from this report; however the total number of "ALL BACTERIA," "ALL GRAM-NEGATIVE BACTERIA," and "ALL GRAM-POSITIVE BACTERIA" listed includes these organisms.
- Reported susceptibilities for "ALL BACTERIA," "ALL GRAM-NEGATIVE BACTERIA," and "ALL GRAM-POSITIVE BACTERIA" reflect estimates only based on the weighted average of susceptibilities for all organisms included on this report as well as those that have been excluded, with assumptions made for those drugs for which susceptibilities were not tested.
- Susceptibility to doxycycline was predicted based on tetracycline susceptibility testing results.
- Only a limited number of coagulase-negative staphylococci isolates were tested for susceptibilities. The vast majority of coagulase-negative staphylococci are susceptible to vancomycin. If you have any questions, please contact the UHN/MSH Department of Microbiology.

#### Organism-Specific Notes:
- Some organisms for which there were only very small numbers have been excluded from this report; however the total number of "ALL BACTERIA," "ALL GRAM-NEGATIVE BACTERIA," and "ALL GRAM-POSITIVE BACTERIA" listed includes these organisms.
- Reported susceptibilities for "ALL BACTERIA," "ALL GRAM-NEGATIVE BACTERIA," and "ALL GRAM-POSITIVE BACTERIA" reflect estimates only based on the weighted average of susceptibilities for all organisms included on this report as well as those that have been excluded, with assumptions made for those drugs for which susceptibilities were not tested.
- Susceptibility to doxycycline was predicted based on tetracycline susceptibility testing results.
- Only a limited number of coagulase-negative staphylococci isolates were tested for susceptibility. The vast majority of coagulase-negative staphylococci are susceptible to vancomycin. If you have any questions, please contact the UHN/MSH Department of Microbiology.

#### Year-Specific Notes:
- Only a limited number of coagulase-negative staphylococci isolates were tested for susceptibilities. The vast majority of coagulase-negative staphylococci are susceptible to vancomycin.
- Some organisms for which there were only very small numbers have been excluded from this report; however the total number of "ALL BACTERIA," "ALL GRAM-NEGATIVE BACTERIA," and "ALL GRAM-POSITIVE BACTERIA" listed includes these organisms.

### General Notes:
- Statistical validity of estimates of percent susceptibility for organisms for which there are fewer than 30 isolates reported is limited. Please take this into consideration when interpreting the reported results.
- Some organisms for which there were only very small numbers have been excluded from this report; however the total number of "ALL BACTERIA", "ALL GRAM-NEGATIVE BACTERIA", and "ALL GRAM-POSITIVE BACTERIA" listed includes these organisms.
- Reported susceptibilities for "ALL BACTERIA", "ALL GRAM-NEGATIVE BACTERIA", and "ALL GRAM-POSITIVE BACTERIA" reflect estimates only based on the weighted average of susceptibilities for all organisms included on this report as well as those that have been excluded, with assumptions made for those drugs for which susceptibilities were not tested.
- Susceptibility to doxycycline was predicted based on tetracycline susceptibility testing results.

### Organism-Specific Notes:
- *M. catarrhalis* : Susceptibility testing is not routinely performed. Most isolates are resistant to ampicillin and amoxicillin but are generally susceptible to other antibiotics commonly used for respiratory infections.
- **H. influenzae** and *H. parainfluenzae* : Susceptibility to amoxicillin was determined using beta-lactamase testing. Beta-lactamase-positive isolates are resistant to amoxicillin but are generally susceptible to ampicillin-clavulanic acid and cefuroxime.
- Beta-hemolytic streptococci: Susceptibility testing to penicillin is generally performed since resistant strains have not been recognized. All isolates are considered susceptible to penicillin.
- *S. maltophilia* : Susceptibility to moxifloxacin was predicted based on levofloxacin susceptibility testing results.
